**CHEMISTRY**

**0620/52**

Paper 5 Practical Test

**February/March 2017**

**1 hour 15 minutes**

Candidates answer on the Question Paper.

Additional Materials: As listed in the Confidential Instructions

**READ THESE INSTRUCTIONS FIRST**

Write your Centre number, candidate number and name on all the work you hand in.

Write in dark blue or black pen.

You may use an HB pencil for any diagrams or graphs.

Do not use staples, paper clips, glue or correction fluid.

DO **NOT** WRITE IN ANY BARCODES.

Answer **all** questions.

Electronic calculators may be used.

You may lose marks if you do not show your working or if you do not use appropriate units.

Notes for use in qualitative analysis are provided on pages 7 and 8.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [ ] at the end of each question or part question.

**For Examiner's Use**

**Total**

The syllabus is approved for use in England, Wales and Northern Ireland as a Cambridge International Level 1/Level 2 Certificate.

This document consists of **8** printed pages.

- 1 You are going to investigate the reaction between dilute hydrochloric acid and two different aqueous solutions of sodium hydroxide labelled solution **O** and solution **P**.

**Read all the instructions carefully before starting the experiments.**

### Instructions

You are going to carry out two experiments.

#### (a) Experiment 1

- Fill the burette up to the 0.0 cm<sup>3</sup> mark with dilute hydrochloric acid.
- Use the measuring cylinder to pour 20 cm<sup>3</sup> of solution **O** into the conical flask.
- Add 10 drops of thymolphthalein indicator to the conical flask.
- Add the dilute hydrochloric acid from the burette 1 cm<sup>3</sup> at a time, while swirling the flask, until the solution just changes colour.
- Record the burette readings in the table.

#### (b) Experiment 2

- Fill the burette up to the 0.0 cm<sup>3</sup> mark with dilute hydrochloric acid.
- Empty the conical flask and rinse it with distilled water.
- Use the measuring cylinder to pour 20 cm<sup>3</sup> of solution **P** into the conical flask.
- Add 10 drops of thymolphthalein indicator to the conical flask.
- Add the dilute hydrochloric acid from the burette 1 cm<sup>3</sup> at a time, while swirling the flask, until the solution just changes colour.
- Record the burette readings in the table and complete the table.

|                                           | Experiment 1 | Experiment 2 |
|-------------------------------------------|--------------|--------------|
| final burette reading / cm <sup>3</sup>   |              |              |
| initial burette reading / cm <sup>3</sup> |              |              |
| difference / cm <sup>3</sup>              |              |              |

[4]

- (c) What colour change was observed in the conical flask in Experiment 1?

from ..... to ..... [1]

- (d) What type of chemical reaction occurs when dilute hydrochloric acid reacts with sodium hydroxide solution?

..... [1]

- (e) (i) Which solution of sodium hydroxide, solution **O** or solution **P**, is the more concentrated? Explain your answer.

.....  
 ..... [2]

- (ii) How many times more concentrated is this solution of sodium hydroxide than the other solution of sodium hydroxide?

..... [1]

- (f) If Experiment 2 were repeated using 10 cm<sup>3</sup> of solution **P**, what volume of dilute hydrochloric acid would be needed?

..... [2]

- (g) What would be the effect, if any, on the volume of dilute hydrochloric acid used in Experiment 1 if the solution of sodium hydroxide were **warmed** before adding the dilute hydrochloric acid? Give a reason for your answer.

effect on volume .....

reason ..... [2]

- (h) (i) What would be a more accurate method of measuring the volume of the sodium hydroxide solution?

..... [1]

- (ii) Suggest how the reliability of the results could be checked.

..... [1]

- (i) Aqueous sodium hydroxide reacts with aqueous calcium chloride to form a precipitate of calcium hydroxide.

Use this information to suggest a **different** method of finding out which of the solutions of sodium hydroxide is the more concentrated.

.....  
 .....  
 .....  
 ..... [3]

[Total: 18]

- 2 You are provided with two solids **Q** and **R** which are both salts.  
Carry out the following tests on each solid, recording all of your observations at each stage.

**tests on solid Q**

- (a) Describe the appearance of solid **Q**.

..... [1]

Add about 10 cm<sup>3</sup> of distilled water to all of solid **Q** in the test-tube and shake to dissolve the solid.

Divide the solution into three equal portions in three test-tubes and carry out the following tests.

- (b) (i) To the first portion of the solution, add drops of aqueous sodium hydroxide until a change is seen.  
Record your observations.

..... [2]

- (ii) Now add an excess of aqueous sodium hydroxide to the mixture.  
Record your observations.

..... [1]

- (c) (i) To the second portion of the solution, add drops of aqueous ammonia until a change is seen.  
Record your observations.

..... [2]

- (ii) Now add an excess of aqueous ammonia to the mixture.  
Record your observations.

..... [1]

- (d) To the third portion of the solution, add a few drops of dilute nitric acid and about 1 cm<sup>3</sup> of aqueous silver nitrate.  
Record your observations.

..... [1]

**Keep your mixture from test (d) to compare the result with test (h).**

- (e) Identify solid **Q**.

..... [2]

**tests on solid R**

- (f) Carry out a flame test on solid **R**.  
Record your observations.

..... [1]

Dissolve the rest of solid **R** in about 5 cm<sup>3</sup> of distilled water in a test-tube. Shake the mixture to dissolve the solid. Divide the solution into two equal portions in two test-tubes.

- (g) To the first portion of the solution, add a few drops of dilute nitric acid and about 1 cm<sup>3</sup> of aqueous barium nitrate.  
Record your observations.

..... [1]

- (h) To the second portion of the solution, add a few drops of dilute nitric acid and about 1 cm<sup>3</sup> of aqueous silver nitrate.  
Compare the result with test (d). Record your observations for test (h).

..... [2]

- (i) Identify solid **R**.

..... [2]

[Total: 16]

**3** When solid barium hydroxide is added to solid ammonium chloride a reaction takes place.

**(a)** Describe an experiment to show that this reaction is endothermic.

.....

.....

.....

.....

.....

..... [4]

**(b)** How could you show whether or not the final mixture contains ammonium ions?

.....

.....

.....

..... [2]

[Total: 6]

**Notes for use in qualitative analysis****Tests for anions**

| anion                                           | test                                                                                  | test result                                                                                            |
|-------------------------------------------------|---------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| carbonate ( $\text{CO}_3^{2-}$ )                | add dilute acid                                                                       | effervescence, carbon dioxide produced                                                                 |
| chloride ( $\text{Cl}^-$ )<br>[in solution]     | acidify with dilute nitric acid, then add aqueous silver nitrate                      | white ppt.                                                                                             |
| bromide ( $\text{Br}^-$ )<br>[in solution]      | acidify with dilute nitric acid, then add aqueous silver nitrate                      | cream ppt.                                                                                             |
| iodide ( $\text{I}^-$ )<br>[in solution]        | acidify with dilute nitric acid, then add aqueous silver nitrate                      | yellow ppt.                                                                                            |
| nitrate ( $\text{NO}_3^-$ )<br>[in solution]    | add aqueous sodium hydroxide, then aluminium foil; warm carefully                     | ammonia produced                                                                                       |
| sulfate ( $\text{SO}_4^{2-}$ )<br>[in solution] | acidify, then add aqueous barium nitrate                                              | white ppt.                                                                                             |
| sulfite ( $\text{SO}_3^{2-}$ )                  | add dilute hydrochloric acid, warm gently and test for the presence of sulfur dioxide | sulfur dioxide produced will turn acidified aqueous potassium manganate(VII) from purple to colourless |

**Tests for aqueous cations**

| cation                             | effect of aqueous sodium hydroxide                          | effect of aqueous ammonia                                       |
|------------------------------------|-------------------------------------------------------------|-----------------------------------------------------------------|
| aluminium ( $\text{Al}^{3+}$ )     | white ppt., soluble in excess giving a colourless solution  | white ppt., insoluble in excess                                 |
| ammonium ( $\text{NH}_4^+$ )       | ammonia produced on warming                                 | —                                                               |
| calcium ( $\text{Ca}^{2+}$ )       | white ppt., insoluble in excess                             | no ppt., or very slight white ppt.                              |
| chromium(III) ( $\text{Cr}^{3+}$ ) | green ppt., soluble in excess                               | grey-green ppt., insoluble in excess                            |
| copper(II) ( $\text{Cu}^{2+}$ )    | light blue ppt., insoluble in excess                        | light blue ppt., soluble in excess, giving a dark blue solution |
| iron(II) ( $\text{Fe}^{2+}$ )      | green ppt., insoluble in excess                             | green ppt., insoluble in excess                                 |
| iron(III) ( $\text{Fe}^{3+}$ )     | red-brown ppt., insoluble in excess                         | red-brown ppt., insoluble in excess                             |
| zinc ( $\text{Zn}^{2+}$ )          | white ppt., soluble in excess, giving a colourless solution | white ppt., soluble in excess, giving a colourless solution     |

**Tests for gases**

| gas                               | test and test results                                                      |
|-----------------------------------|----------------------------------------------------------------------------|
| ammonia (NH <sub>3</sub> )        | turns damp, red litmus paper blue                                          |
| carbon dioxide (CO <sub>2</sub> ) | turns limewater milky                                                      |
| chlorine (Cl <sub>2</sub> )       | bleaches damp litmus paper                                                 |
| hydrogen (H <sub>2</sub> )        | 'pops' with a lighted splint                                               |
| oxygen (O <sub>2</sub> )          | relights a glowing splint                                                  |
| sulfur dioxide (SO <sub>2</sub> ) | turns acidified aqueous potassium manganate(VII) from purple to colourless |

**Flame tests for metal ions**

| metal ion                      | flame colour |
|--------------------------------|--------------|
| lithium (Li <sup>+</sup> )     | red          |
| sodium (Na <sup>+</sup> )      | yellow       |
| potassium (K <sup>+</sup> )    | lilac        |
| copper(II) (Cu <sup>2+</sup> ) | blue-green   |
